

Project Concept: AI Vision Board & Goal Companion

1. Core Idea

A web or mobile app where users:

- **Create vision boards** with goals and milestones.
- **Add daily tasks or journal entries** linked to each goal.
- **Receive AI suggestions** for maximizing effort toward goals.
- **Track progress visually** (percent completion, milestone proximity).
- **Link related goals** automatically and suggest synergistic actions.

2. Key Features

Feature	Description
Vision Board	Users can create goals with images, text, or icons. Think Pinterest-style “board” for personal milestones.
Daily Task & Journaling	Users log daily actions. AI uses this to track consistency and progress.
Progress Tracker	Shows % completion toward each milestone and highlights gaps.
AI Goal Optimization	Suggests actionable steps, flags related tasks/goals, and prioritizes actions for maximum impact.
Goal Linking & Synergy	Automatically identifies connections between goals. Example: Traveling abroad → find speaking events → practice global presentations.
Fun Micro-Tasks	Suggests engaging actions aligned with goals. Example: Car goal → window shopping, driving school, car shows.
Insight Dashboard	Visual representation of progress, AI suggestions, and related goal connections.

3. AI Functionality

- **Task Analysis:** LLM evaluates tasks logged and provides suggestions on improving alignment with goals.
- **Goal Connection:** Detects related goals and suggests synergistic actions.
- **Effort Optimization:** Highlights which tasks are high-impact for milestone progress.
- **Progress Estimation:** Calculates % of milestone completion based on tasks completed vs tasks suggested.
- **Smart Prompts:** Example prompts for AI:
 - “Given my goal of speaking at a global event and traveling abroad, what can I do to achieve both?”
 - “I want to buy a car next month — suggest fun tasks to get closer to this goal.”

4. Hackathon MVP Scope

For the hackathon, we don't need full-fledged AI planning yet; we focus on a **working prototype**:

1. Frontend:

- Drag-and-drop vision board creation (React.js + Tailwind).
- Daily task/journal entry interface.

2. Backend:

- Python FastAPI or Flask.
- Store users, boards, goals, tasks, journals (SQLite/Postgres).
- AI agent endpoints to process suggestions and goal linking.

3. AI Layer:

- Use OpenAI GPT API for suggestion generation.
- Optional: LangChain to structure multi-step reasoning (goal linking).

4. Visuals:

- Progress bars for each milestone.
- Suggested tasks highlighted with AI recommendations.
- Goal linking lines or icons showing synergy.

5. Hackathon Demo Flow

1. User creates a vision board and sets 2–3 goals.
2. Adds daily tasks or journal entries.
3. AI evaluates tasks and gives suggestions:
 - Percent progress toward milestones.
 - Task recommendations or adjustments.
 - Connections between goals.
4. The user clicks a suggested task → updates their journal → sees updated % completion.
5. Optional fun demo: “If I plan a trip abroad, can I also work toward my speaking goal?” → AI suggests actionable next steps.
